Mechanism of Action

The active ingredient in [Tadaga 5](#) is [tadalafil 5mg](#). It works by inhibiting the action of PDE5, an enzyme that breaks down cyclic guanosine monophosphate (cGMP). This inhibitory action permits the cGMP to build up and perform its function of relaxing penile smooth muscles, thus increasing blood flow. An increase in flow of blood to the genital part assists with erections.

Usage and Dosage

[Tadaga 5](#) is usually swallowed with or without food, as directed by a doctor. Dosage is usually recommended to be 5mg once a day, but may vary with individual reactions and tolerance. The recommended dose must be followed, and the amount taken should not exceed this dose. If an overdose occurs, then there is a greater danger of adverse side effects occurring.

Effectiveness

[Tadalafil 5mg](#) has been proven to be effective in clinical studies for the treatment of ED. Compared to the placebo, it has shown significant improvement in erectile function.
