What is [Tadapox](#)?

[Tadapox](#) is a combination medication that contains **20mg** of [Tadalafil](#) and **60mg** of [Dapoxetine](#). [Tadalafil](#) 20mg, a phosphodiesterase type 5 (PDE5) inhibitor, is renowned for its effectiveness in treating ED by enhancing blood flow to the penile region. [Dapoxetine](#) 60mg, a selective serotonin reuptake inhibitor (SSRI), is known for its role in managing PE by prolonging the time to ejaculation. The synergistic combination of these two active ingredients in [Tadapox](#) offers a comprehensive solution to both ED and PE.

Benefits of [Tadapox](#):

1. [Tadapox](#) provides a dual-action approach, effectively addressing both ED and PE in a single medication. This makes it a convenient and comprehensive solution for men experiencing both conditions simultaneously.
2. By improving blood flow to the genital part, [Tadalafil](#) in [Tadapox](#) helps men achieve and maintain a firm erection, promoting a satisfying sensual experience.

Meanwhile, Dapoxetine contributes to delaying ejaculation, extending the duration of sensual activity.

How Tadapox Works

Tadapox works by targeting the underlying causes of both ED and PE:

ED Mechanism:

Tadalafil 20mg inhibits the action of PDE5, an enzyme that breaks down cyclic guanosine monophosphate (cGMP). This results in increased levels of cGMP, promoting relaxation of smooth muscles and vasodilation in the penile region. The improved blood flow to the genital part leads to a sustained and firm erection.

PE Mechanism:

Dapoxetine 60mg works by inhibiting the reuptake of serotonin, a neurotransmitter that plays a role in ejaculation control. By increasing serotonin levels, Dapoxetine helps delay the ejaculatory reflex, extending the time to ejaculation and improving control over climax.
