### How [Maxgun 100](#) Works

Sildenafil 100mg, the active ingredient in Maxgun 100, belongs to a class of medications known as phosphodiesterase type 5 (PDE5) inhibitors. These drugs work by increasing blood flow to the genital part, making it easier to achieve and maintain an erection. Here's how Maxgun 100mg works:

- **Improved Blood Flow:** When a man is sensually aroused, the body releases nitric oxide, which relaxes the blood vessels in the genital part. This allows blood to flow into the erectile tissues, causing an erection. However, in men with ED, the enzyme PDE5 can break down nitric oxide too quickly, preventing adequate blood flow. Maxgun 100mg inhibits PDE5, allowing nitric oxide to work more effectively and promoting better blood flow to the genital part.

- **Easier Erection:** With improved blood flow, it becomes easier for men to achieve and sustain an erection when sensually stimulated. This can result in a more enjoyable and sensual experience.
- **Delayed Ejaculation:** Some men with delayed ejaculation may also benefit from [Maxgun 100mg](#), as it can help maintain an erection for a longer duration, potentially reducing the time required to ejaculate.

## Dosage and Usage

It's crucial to follow the prescribed dosage and usage instructions for [Maxgun 100mg](#) to ensure both safety and effectiveness. Typically, the recommended starting dose is 50mg, taken approximately 30 minutes to 1 hour before sensual activity. However, the dosage can be adjusted based on individual needs and tolerances. It's essential to consult a healthcare provider for a personalized recommendation.

It's worth noting that [Maxgun 100mg](#) should not be taken more than once a day, and alcohol consumption should be minimized, as excessive alcohol can reduce the effectiveness of the medication. Additionally, a high-fat meal can delay the onset of action, so it's advisable to take [Maxgun 100mg](#) on an empty stomach for faster results.
