The following are the various causes of Impotence in males

1. High blood pressure (hypertension) : A lot of time physical issues can cause [erectile disorder](#). The most common causes include chronic high blood pressure or hypertension. Men who suffer from hypertension are more likely to suffer from erectile disorder as compared with men with normal blood pressure.

A huge number of men don't report the problem of [erectile disorder](#) to their healthcare providers. Hypertension harms the blood vessels and makes the arteries supply the flow of blood to the male organ in a normal way. Due to this, the male organ does not get enough blood. It does not become hard and erect. Men who suffer from hypertension are likely to have low testosterone. There is a strong link between hypertension and low testosterone.

2. Type 2 diabetes : With the help of insulin, the body performs the conversion of food into energy. When you suffer from Type 2 diabetes you are unable to use the hormones in the right way. Even it can cause high blood sugar levels. It can damage the vascular and nervous systems. Men suffering from diabetes are more likely to suffer from [erectile disorder](#). Men with Type 2 diabetes suffer from [male sensual dysfunction](#). Type 2 diabetes can even increase the risk of heart disease. It can even inhibit the sensation in the male organ.

3. Depression and other mental health issues : If you are suffering from Depression and other mental health issues then your risk of erectile disorder significantly increases. If you are in a complicated relationship then you are more likely to suffer from mental health concerns and hence [erectile disorder](#). Mental health issues such as depression or anxiety can cause an imbalance in the brain chemicals. It can even interrupt your signals from the brain to your male organ. If you are anxious or depressed, it can make the ED symptoms worse.
